During one of HEVY's onsite visits at a nickel mine customer in 2015, our team received praise and gratitude for two DBH-100 pumps we had provided them in 2009. The Nickel Mine maintenance manager stopped our regional manager congratulating him stating:

*"These two HEVY DBH's are the best pumps I have worked with throughout all my years in this plant!"*

This was a great success for HEVY as the nickel mine industry is a difficult one to please.

The application our DBH 100's were installed into was acid water at 131°F, pH 2.6, the flow rate requirement being 481 gpm at 324 ft. After our company was notified of the application requirements, we knew that our DBH pumps would be able to handle the customer's specs. Our H<sub>2</sub>S removal dehumidifier water recovery pumps, DBH 100/75, are heavy duty with a speed of 2050 rpm and a 100hp motor. These pumps are Alloy 20 and CD4MCu. They were designed to survive in the toughest applications.
